

Quantitative assay for determining the Minimum Inhibitory Concentration (M.I.C.)

MTS™ is a quantitative assay for determining the Minimum Inhibitory Concentration (M.I.C.) of antimicrobial agents against microorganisms and for detecting the resistance mechanisms.

MTS™ are porous strips with special features that are impregnated with a predefined concentration gradient of antibiotic, across 15 two-fold dilutions of a conventional M.I.C. method.

On one side of the strip is indicated a M.I.C. scale in µg/mL and a code that identify the antimicrobial agent.

For ESBL, MBL, GRD, AmpC and KPC detection, the double-sided gradient carries the appropriate diagnostic reagents.

MTS™ are available in a large variety of configurations. Each configuration is available in packages of 10, 30 and 100 tests.

Mixed culture on Chromatic MH
MTS™ Meropenem 0.002-32 µg/mL

S. aureus ATCC® 29213
MTS™ Aztreonam-Avibactam 0.016/4-256/4 µg/mL
M.I.C. = 0.125 µg/mL

method principle

When the **MTS™** is applied onto an inoculated agar surface, the preformed exponential gradient of antimicrobial agent is transferred to the agar matrix.

After 18 hours incubation or longer, a symmetrical inhibition ellipse centered along the strip is formed. The MIC is read directly from the scale in terms of µg/mL at the point where the edge of the inhibition ellipse intersects the **MTS™**.

Other growth/inhibition patterns may also be seen for resistance detection methods.

C. freundii isolate
MTS™ Imipenem-relebactam 0.002/4-32/4 µg/mL
M.I.C. = 0.25 µg/mL

S. aureus ATCC® 29213
MTS™ Delafloxacin 0.002-32 µg/mL
M.I.C. = 0.004 µg/mL
